The Patent Office Concept House Cardiff Road Newport South Wales NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely such a company to certain additional company law rules.

AN Excess.

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

### CLEANING METHOD

This invention relates to a method of softening water and/or in which the deposition of hard water scale is The invention relates in particular to such a inhibited. method carried out in a domestic environment, in particular in ware-washing machines. The invention also relates to compressed water-softening compositions for such methods.

10

15

25

30

It is well known that certain metal compounds, notably calcium compounds, when present in water, have a significant effect on the properties of the water. example, "hard" water containing a significant loading of soluble calcium and magnesium compounds may require a large amount of soap or detergent in order to form a lather. Scale deposits can readily form from such water, for example on heating or pH change or evaporation. These can be encrustations, or watermarks left on 20 evaporation of water droplets from, especially, a shiny surface.

There have been many proposals for removal of metal ions from aqueous solutions. In the industrial context proposals have included filter beds and polymeric filters for capturing heavy metal ions from an aqueous solution flowing within a passageway. Examples are given in EP992238A and GB20869564A. In the domestic context chelating compositions can be added to an aqueous washing solution and these can capture metal ions, such as calcium ions. Examples of chelating compositions are given in EP892040A.

Increasingly popular is the delivery of cleaning and water-softening compositions as compressed compositions, typically a tablet. These are convenient providing a unit dosage which is easily handled. Difficulties arise in the production of such compressed compositions in balancing the needs that the compressed composition is suitably hard and non-friable under transportation conditions but yet is not so compacted that it cannot easily disintegrate. Suitable levels of "hardness" are between 10 150 N and 250 N (the test conditions being set out in the Example section). Suitable levels of "friability" are between 2% and 9% (the test conditions being set out in the Example section). Suitable "disintegration" times are between 5 seconds and 180 seconds, when placed in 11 of 15 gently stirred water at 25°C.

It is well known in the art to include a disintegrant, which will promote disintegration of the tablet in laundry detergent tablets and laundry detergent 20 additive tablets. Various classes of disintegrants are known, including the class in which disintegration is caused by the swelling of the disintegrant. Various swelling disintegrants have been proposed in the literature, for instance in WO 98/54283, with the 25 preference being directed predominantly towards starches, celluloses and water soluble organic polymers. Furthermore, inorganic swelling disintegrants such as bentonite clay have also been mentioned, for instance in 30 EP-A-0 466 484.

We have found that water softening compositions are particularly difficult compositions to compress and retain as a compressed solid. This is mainly due to the high content of crystalline solids, for example, sodium citrate, that do not easily bind together. Therefore, much higher compression forces are needed to produce suitable compressed compositions. Compression forces used are greater than 35KN, 40KN, 45KN or 50KN. However, compression forces are usually less than 100KN, 95KN, 90KN, or 85KN.

We have found a particularly suitable water softening composition for the formation of a compressed composition that provides high levels of hardness of at least 100N, 150N, 175N or 200N. Hardness levels are usually less than 300N, 275N or 250N. An acceptably low lend of friability of less than 15%, 10% or 8%. Low disintegration times of less than 1 minute are achieved ideally BETWEEN 20 AND 30.

20

10

15

Therefore, we present as a first feature of the invention a compressed water softening composition comprising at least one water-softening active and a blend of disintegrating agents comprising

- 25 (a) cross linked polyplasdone;
  - (b) a water-swellable cellulose; and, optionally,
  - (c) a water-soluble salt.

By the use of the term water-softening composition we mean that the composition is substantially free of surfactant and/or bleach ingredients, i.e. less than 5% or 1% by weight.

The blend of disintegrating agents is present in an amount of up to 10%, 8%, 7%, 6%, 5%, 3% or 2% wt of the composition. The blend of disintegrating agents is present in an amount of at least 0.1%, 0.3%, 0.5%, 0.7%, 0.9%, 1.1%, 1.3%, 1.5% or 1.7% wt of the composition.

# Water Softening Active

10

Water-softening actives are present in the composition in an amount of at least 40%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85% or 90% by weight of the composition. Maximum amounts of water-softening actives are present in an amount of less than 99%, 97%, 93%, 90%, 87%, 83% or 80% by weight of the composition.

There are three main types of method of action for water softening actives, described below.

20

25

15

1) Ion exchange agents - such agents include alkali metal (preferably sodium) aluminosilicates either crystalline, amorphous or a mixture of the two. Such aluminosilicates generally have a calcium ion exchange capacity of at least 50 mg CaO per gram of aluminosilicate, comply with a general formula:

 $0.8\text{--}1.5~\text{Na}_2\text{O}$  .  $\text{Al}_2\text{O}_3$  .  $0.8\text{--}6~\text{SiO}_2$ 

and incorporate some water. Preferred sodium aluminosilicates within the above formula contain 1.5-3.0 SiO<sub>2</sub> units. Both amorphous and crystalline

aluminosilicates can be prepared by reaction between sodium silicate and sodium aluminate, as amply described in the literature.

Suitable crystalline sodium aluminosilicate ionexchange detergency builders are described, for example, in GB 1429143 (Procter & Gamble). The preferred sodium aluminosilicates of this type are the well known commercially available zeolites A and X, and mixtures thereof. Also of interest is zeolite P described in EP 384070 (Unilever).

Another class of compounds are the layered sodium silicate builders, such as are disclosed in US-A-4464839 and US-A-4820439 and also referred to in EP-A-551375.

These materials are defined in US-A-4820439 as being crystalline layered, sodium silicate of the general formula

20

NaMSixO2x+1 . YH2O

where

25 M denotes sodium or hydrogen, x is from 1.9 to 4 and y is from 0 to 20.

Quoted literature references describing the preparation of such materials include Glastechn. Ber. 37,194-200 (1964), Zeitschrift für Kristallogr. 129, 396-404 (1969), Bull. Soc. Franc. Min. Crist., 95, 371-382 (1972) and Amer. Mineral, 62, 763-771 (1977). These

materials also function to remove calcium and magnesium ions from water, also covered are salts of zinc which have also been shown to be effective water softening agents.

5

10

- 2) Ion capture agents agents which prevent metal ions from forming insoluble salts or reacting with surfactants, such as polyphosphate, monomeric polycarbonates, such as citric acid or salts thereof, EDTA, algins, alginates.
- 3) Anti-nucleating agents agents which prevent seed crystal growth, such as polycarbonate polymers, such as polyacrylates, acrylic/maleic copolymers, and acrylic phosphonates, and sulfonates.

# Water-soluble salt

The water-soluble salt is an optional, but preferred, constituent of the disintegrant blend. Ideally it is

20 present in amounts of up to 0.1% possibly up to 0.2, 0.4, 0.6, 0.8. 1.0, 1.2 or 1.4% by weight of the composition. Ideally the water-soluble salt is provided as at least 5%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80% or 85% by weight of the

25 disintegrant blend. Ideally the water-soluble salt is provided as no more than 95%, 90%, 85%, 80%, 75%, 70%, 65%, 60%, 55%, 50%, 45%, 40%, 35%, 30%, 25%, 20%, 15% or 10% by weight of the disintegrant blend.

Ideally the water-soluble salt has a solubility of at least 50 g/100 g of deionized water at 20°C. This is an exceptionally high solubility: many materials which are

10

15

classified as water-soluble are less soluble. Suitable highly water-soluble materials which may be used are selected from, with their solubilities expressed as grams of solid to form a saturated solution in 100 g of deionized water at 20°C: potassium acetate >200, sodium citrate dihydrate 72, potassium carbonate 112, urea > 100, sodium acetate anhydrous 119, sodium acetate trihydrate 76 and magnesium sulphate 7H2O 71 or mixtures thereof.

The rapid dissolution of the water-soluble salt provides rapid ingress of water into the tablet, thus not only affecting the tablet's integrity, but also allowing water to rapidly access the other disintegrant components within the tablet, particularly the swelling disintegrants.

By contrast the solubilities of some other common materials at 20°C are: sodium chloride 36, sodium sulphate decahydrate 21.5, sodium carbonate anhydrous 6.0, sodium percarbonate anhydrous 12, sodium perborate anhydrous. Preferably this highly water soluble material is incorporated as particles of the material in a substantially pure form (i.e. each such particle contains over 95% by weight of the material).

## 25 Cross Linked Polyplasdone

Ideally in amounts of up to 0.1% possibly up to 0.2, 0.4, 0.6, 0.8. 1.0, 1.2 or 1.4% by weight of the composition. Ideally the cross linked polyplasdone is

10

15

provided as at least 5%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80% or 85% by weight of the disintegrant blend. Ideally the cross linked polyplasdone is provided as no more than 95%, 90%, 85%, 80%, 75%, 70%, 65%, 60%, 55%, 50%, 45%, 40%, 35%, 30%, 25%, 20%, 15% or 10% by weight of the disintegrant blend.

Cross linked polyplasdone consists of N-vinyl-2-pyrrolidone polymerised and cross-linked simultaneously by a reaction known as "pop-corn" polymerisation. The unique structure of cross linked polyplasdone (sometimes referred to as crospovidone) provides superior adsorptive capacity and exceptional swelling rate. Suitable methods for preparing cross linked polyplasdone can be found in EP 1263814 & EP 1036839.

### Water-swellable Cellulose

Ideally in amounts of up to 0.1% possibly up to 0.2, 0.4, 0.6, 0.8. 1.0, 1.2 or 1.4% by weight of the composition. Ideally the water- swellable cellulose is provided as at least 5%, 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80% or 85% by weight of the disintegrant blend. Ideally the water-swellable cellulose is provided as no more than 95%, 90%, 85%, 80%, 75%, 70%, 65%, 60%, 55%, 50%, 45%, 40%, 35%, 30%, 25%, 20%, 15% or 10% by weight of the disintegrant blend.

Suitable water-swellable cellulose materials have 30 sufficient water-absorptivity that they can absorb at least 15, 12, 10, 8, 6, 4, 2, 1 times their own weight of 10

15

20

additional disintegrant.

water, ie. a water uptake of at least 15, 12, 10, 8, 6, 4, 2, 1 g per g of deionised water at 20°C.

A number of such materials are known, and which may be chemically modified to enhance its water uptake capacity. Sometimes such modified celluloses have ionic substituents but for this invention it is preferred that any substituents are nonionic.

For the avoidance of doubt water-swellable cellulose does not include microcrystalline cellulose commonly used in compacted compositions. Microcrystalline cellulose is used as a wicking agent to bring water into the compacted composition to aid disintegration and is not water-swellable, or at least is not water-swellable to the extent required in the present invention.

Microcrystalline cellulose may be included as an

The compositions may be used in ware washing using a machine or a manual method. The compositions may also be used to soften water in other cleaning methods such as hard surfaces, for example using a hand-cloth or mop, and an open vessel, for example a bucket or bowl. Thus, the cleaning method could be a method of cleaning a hard surface, for example a window, a tiled surface, shower screen, dirty tableware and kitchenware, a sanitary article, for example a bath, shower screen, lavatory, wash basin or sink, a car or a kitchen worktop.

The invention will now be described, by way of embodiment, with reference to the following Examples.

# Examples

## Hardness Test

Using a dynamometer with a test piston diameter of 8 mm and a piston speed 30 mm per minute (a machine such as the ERWEKA tablet hardness tester THB 30 may be used) the maximum hardness of the tablet just prior to breakage is recorded for 4 tablets in the same orientation and averaged.

# Friability Test

Ten tablets are weighed and placed into a square
plastic sample holder of approximate dimensions
110×110mm square by 170mm long. The sample holder is
rotated horizontally along it length at 50 rpm for 1
minute. The tablets are weighed again and the amount of
material loss expressed as percentage

20

5

10

% friability index = 
$$\frac{W_0 - W_1}{W_0} \times 100$$

where:

 $W_0$  = initial weight

 $W_1$  = weight of the tablets after one minute of test at 50 rpm.

30

25

-11-

The tablets were pressed at between 50 and 80N. The hardness was measured at between 180 and 260N, the friability was AROUND 4% and dissolution times of between 20 and 30 seconds were found.

#### CLAIMS

5

- A compressed water-softening composition comprising at least one water-softening active and a blend of disintegrating agents comprising
  - (a) cross linked polyplasdone;
  - (b) a water swellable cellulose and, optionally,
  - (c) a water soluble salt.
- 10 2. A compressed water-softening composition as claimed in claim 1 wherein the composition is substantially free of surfactant and/or bleach ingredients.
- 3. A compressed water-softening composition as claimed
  in claim 1 or 2 wherein the blend of disintegrating
  agents is present in an amount of up to 10% by weight
  of the composition.
- 4. A compressed water-softening composition as claimed in 3 wherein the blend of disintegrating agents is present in an amount of at least 0.1% by weight of the composition.
- 5. A compressed water-softening composition as claimed in any claim from 1 to 5 wherein the water-soluble salt has a solubility of at least 50g/100g of deionised water at 20°C.
- 6. A compressed water-softening composition as claimed
  in any claim from 1 to 6 wherein the water-swellable
  cellulose has a water uptake of at least 15g of

### ABSTRACT

### CLEANING METHOD

This invention relates to a method of softening water and/or in which the deposition of hard water scale is inhibited. The invention relates in particular to such a method carried out in a domestic environment, in particular in ware-washing machines.
